

Allied Health Standard Terminology Mapping & Data models

The digital ecosystem of Allied Health Primary and Tertiary Health care

Hospital and outpatient health data can enhance the service delivery of primary allied health practitioners by ensuring they have holistic information about consumers available at the point of care.

This workshop will give an overview of the current status of the allied health sectors integration to the digital ecosystem, identify the challenges and barriers which exist and the work being done to remove these so that information can flow between the primary allied health sector and the tertiary health system.

The workshop will focus on developing an understanding of the essential nature of utilising consistent terminology data standards to share information digitally and in real time. Participants will be given an opportunity to identify and detail the use cases within their clinical workload where the use of consistent terminology data standards would solve challenges and enhance the quality-of-care delivery and outcomes for consumers. Subsequently, this workshop will both assist participants learning within the digital space and enable the opportunity to influence the development of the national consistent terminology data standards, potentially including the development of e-forms and other solutions.

Take the opportunity to learn and contribute to solving clinical problems at a holistic level to shape the healthcare system we all work within and empower the lives of your consumers.
